Privileged Access Management

Solving for COVID-19, Together.

Solution overview

Privileged access management (PAM) consists of the cybersecurity strategies and technologies for exerting control over the elevated ("privileged") access and permissions for users, accounts, processes, and systems across an IT environment. By dialing in the appropriate level of privileged access controls, PAM helps organisations condense their organisation's attack surface, and prevent, or at least mitigate, the damage arising from external attacks as well as from insider malfeasance or negligence.

With the requirement for more people to work from home it's become even more important to manage the access permissions of who has access to what and when. BeyondTrust is a recognized leader in Privilege Access solutions.
