

INTEDEX

Data Harmonisation for SAP R/3

It may be interesting to know that if you were to sit on the planet Neptune, the SUN itself would only be the size of the full stop at the end of this sentence. If the Sun were to be drawn the size of a pea, Neptune would be off the page 14km away. The Solar System is a very large place. It would be hard to consider that the SUN has any effect on Neptune, but even so the Sun still keeps Neptune in its orbit.

SAP systems are similar. They start off with a big bang, but as time passes, Dev and QA orbit further and further away from Production until the gaps in data are so vast that these systems no longer orbit and no

longer have relevance to the system as a whole. An ever increasing amount of effort and resources are needed to keep these systems relevant. Effort costing time and money.

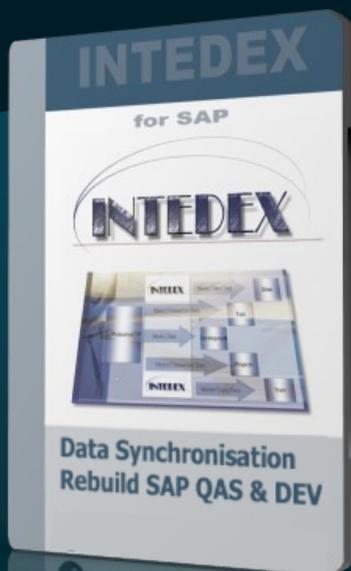

Intedex remedies this by revitalizing the data on each support system, harmonising the data between systems, drawing them back into your planetary system and making them relevant to your support process. Intedex can rebuild portions of data while securing data that is specific to that system. Master Data and application specific data can be harmonized on a regular basis and without requiring a large data transfer footprint.

INTEDEX harmonises data between SAP systems. Synchronising only the data that you need, allowing you to manage your systems more effectively. Differentiating between master data, application specific data, industry-solutions and custom applications. Intedex can even specify a slice of data to be refreshed. 80% of the time you only need Master data that is rarely larger than 20% of your data. Master data that can be refreshed in minutes.

SPECIAL INTEREST POINTS

- EASY SYSTEM REBUILD
- REVIVE DEV AND QA FROM PRD
- NO HARDWARE REQUIREMENTS
- SLICE PORTIONS OF DATA

If you lose a week each month rebuilding QA or only rebuild DEV once a year, then you should be using INTEDEX.
